Background

Information Spread over Social Network

- Diffusion by social interaction

Virus

Rumor

Political Party

- Online social network of unprecedented scale

Such as Facebook and Twitter connects a huge number of people at a single time

Background

Advertising opportunity via social network

Daily Active Users (DAUs)

In Millions

facebook

- Rest of World
- Asia-Pacific
- Europe
- US & Canada

DAUs / MAUs

Quarter	Q3'14	Q4'14	Q1'15	Q2'15	Q3'15	Q4'15	Q1'16	Q2'16	Q3'16
DAUs / MAUs	64%	64%	65%	65%	65%	65%	66%	66%	66%

How to
maximization
the influence?

Survey: 1,713 companies in USA [Salesforce 2015]

- 72% will increase cost for social marketing
- 78% have a dedicated social media team
- 70% believe social marketing is core

Seeding Problem

New products
product promotion

Find people as
seed nodes

Core problem : how to
choose seed set?

Spread information
in social network

Continue until all
information or meet  people get
time deadline

Reach maximum
customers

Some people are
influenced by the
information

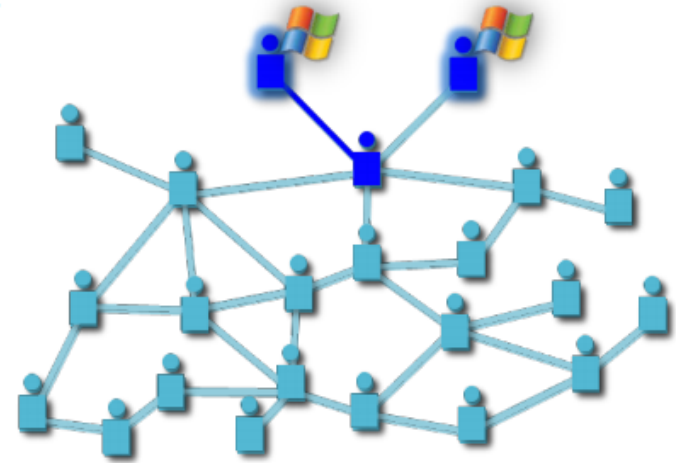

Seeding Problem

Influence spreads through seed nodes in the network
Great difference between different seeding strategies.

 : *New product*

*A good seeding influences
over 17 people.*

*A bad seeding influences over
only 1 person.*

Seeding Problem Model

Social network Structure

- Consider people as nodes, connection as edges
- Social network as Graph $G=(V,E)$
 V --- nodes E --- edges
- Activation probability or weight on edges

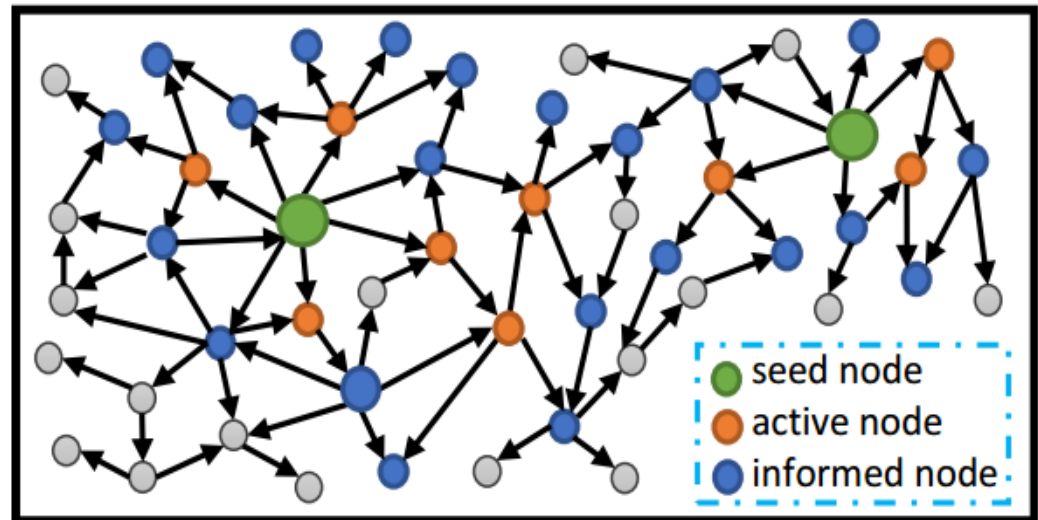

Seeding Problem Model

Two main models

- Linear threshold model (LT)
- Independent cascade model (IC)

Types of nodes

- **Seed** --- nodes being chosen to start diffuse
- **Active** --- adopting the new information or product
- **Informed** --- get the information but not spread
- **Inactive**

Linear threshold model (LT)

- Node receives information from threshold number of nodes then it will change state and start to diffuse influence.

Independent cascade model (IC)

- Works based on activation probability of other neighbor nodes and node have single chance to get activated.

My consider

- All the existing works focus on the maximization of the total active nodes in the event lifespan or in a limited time period.
- But as a company, their paramount goal is to maximize revenue.

How to maximize revenue in
Influence Propagation?

Report outline

- ① Background
- ② Related Work
- ③ Model and Solution
- ④ Experiments

Assumptions

- Closed world --- people can only be influenced by other members of the network and information spreads because of informational cascades .
- Each seed node has identical cost and the revenues are different according to the type of nodes.
- Using IC to express the diffusion of the information in my model.
- Activated users immediately become seeds and have the same willingness of diffusion.

Toy Example

- $\text{cost}(A) > \text{cost}(B)$
before : A or B randomly
revenue : choose B

- budget 2 node , payoff = 1
- $\text{cost}(D) = 5$
- $\text{cost}(M) = \text{cost}(X) = 1$

before :

D and M or X randomly

revenue : choose M and X

Model

Social network Structure

- **Social network as Graph $G=(V,E,P)$**

V --- nodes E --- edges P --- diffusion probability matrix

- **Node set :**

S --- seed nodes A --- active nodes I --- informed nodes

- **Notation**

Seed cost : c active node pay p_a informed node pay p_i if:

Revenue : $r(S) = p_a * |A| + p_i * |I| - c * |S|$ $\forall |S| \leq k$

(k is the maximum seed set size within budget)

- **Target** $\arg \max_S r(S)$

Algorithm 1: GeneralGreedy Algorithm

Input: seed budget k , $G = (V, E, P)$

Output: seed set S , revenue rev

```
1 initialize  $S = \emptyset$  and  $R$ ;  
2 for  $i = 1$  to  $k$  do  
3   | for each node  $n \in V \setminus S$  do  
4   |   |  $s_n = 0$ ;  
5   |   | for  $i = 1$  to  $R$  do  
6   |   |   |  $s_n + = |Random(S \cup \{n\})|$ ;  
7   |   | end  
8   |   |  $s_n = s_n / R$ ;  
9   | end  
10  |  $S = S \cup \{\arg \max_{n \in V \setminus S} \{s_n\}\}$ ;  
11 end  
12  $rev = r(S)$ ;  
13 return  $S, rev$ ;
```

Algorithm 2: ImproveICGreedy Algorithm

Input: seed budget k , $G = (V, E, P)$ **Output:** seed set S , revenue rev

```

1 initialize  $S = \emptyset$  and  $R$ ;
2 for  $i = 1$  to  $k$  do
3   for each node  $n \in V \setminus S$  do
4      $s_n = 0$ ;
5   end
6   for  $i = 1$  to  $R$  do
7     compute  $G'$  by removing each edge from  $G$  with
      probability  $1 - p$ ;
8     compute  $N_{G'}(S)$ ;
9     compute  $|N_{G'}(n)|$  for all  $n \in V$ ;
10    for each node  $n \in V \setminus S$  do
11      if  $n \notin N_{G'}(S)$  then
12         $s_n + = |N_{G'}(n)|$ ;
13      else
14        end
15    end
16  end
17   $s_n = s_n / R$  for all  $n \in V \setminus S$ ;
18   $S = S \cup \{\arg \max_{n \in V \setminus S} \{s_n\}\}$ ;
19 end
20  $rev = r(S)$ ;
21 return  $S, rev$ ;

```

Algorithm 3: Revenue Maximization Greedy Algorithm**Input:** seed budget k , $G = (V, E, P)$ **Output:** seed set S , revenue rev

```
1 initialize  $S = \emptyset$ ;  
2 initialize  $max\_r = 0$ ;  
3 initialize  $S' = \emptyset$ ;  
4 for each node  $n$  in  $V$  do  
5   | compute  $\Delta(n) = r(n)$ ;  
6   |  $flag_n = 0$ ;  
7 end  
8 while  $|S'| < k$  do  
9   |  $n = \arg \max_{n \in V \setminus S'} \Delta(n)$ ;  
10  | if  $flag_n == |S'|$  then  
11  |   |  $S' = S' \cup n$ ;  
12  |   | if  $r(S') > max\_r$  then  
13  |   |   |  $S = S'$ ;  
14  |   |   |  $max\_r = r(S')$ ;  
15  |   | else  
16  |   |   | continue;  
17  |   | end  
18  | else  
19  |   | compute  $\Delta(n) = r(S' \cup n) - r(S')$ ;  
20  |   |  $flag_n = |S'|$ ;  
21  | end  
22 end  
23  $rev = max\_r$ ;  
24 return  $S, rev$ ;
```

ALGORITHM

Algorithm 4: Degree Rank Algorithm

Input: seed budget k , $G = (V, E, P)$

Output: seed set S , revenue rev

```
1 initialize  $S = \emptyset$ ;  
2 initialize  $C = \emptyset$ ;  
3 for each node  $n$  in  $V$  do  
4   |  $Degree(n) = OutDegree(n)$ ;  
5 end  
6 while  $k > 0$  do  
7   | while  $|S| < k$  do  
8     |  $n = \arg \max_{n \in V \setminus S} Degree(n)$ ;  
9     |  $S = S \cup n$ ;  
10    |  $C = C \cup OutNeighbour(n)$ ;  
11    | for each node  $n$  in  $V \setminus S$  do  
12      |  $Degree(n) =$   
13      |  $OutDegree(n) - |C \cap OutNeighbour(n)|$ ;  
14    | end  
15  |  $k = k - 1$ ;  
16 end  
17  $rev = r(S)$ ;  
18 return  $S, rev$ ;
```

Algorithm 5: Degree Discount Algorithm

Input: seed budget k , $G = (V, E, P)$

Output: seed set S , revenue rev

```
1 initialize  $S = \emptyset$ ;  
2 for each node  $n$  in  $V$  do  
3   | compute  $Degree(n)$ ;  
4   |  $dDegree(n) = Degree(n)$ ;  
5   |  $flag_n = 0$ ;  
6 end  
7 for  $i = 1$  to  $k$  do  
8   |  $u = \arg \max_n \{dDegree(n) | n \in V \setminus S\}$ ;  
9   |  $S = S \cup u$ ;  
10  | for each neighbour  $n$  of  $u$  and  $n \in V \setminus S$  do  
11    |  $flag_n = flag_n + 1$ ;  
12    |  $dDegree(n) = Degree(n) - 2flag_n -$   
13    |  $(Degree(n) - flag_n)flag_n p$ ;  
14  | end  
15  $rev = r(S)$ ;  
16 return  $S, rev$ ;
```

Report outline

- ① Background
- ② Related Work
- ③ Model and Solution
- ④ Experiments

Experiments Setting

Real - life network

collaboration graph of High Energy Physics – Theory section, from year 1991 to year 2003.

It has 15233 nodes and $m = 58891$ edges.

Set of algorithms

- **Random** ---- baseline comparison, simply select k random nodes in the graph.
- **IIC** ---- The ImprovedICGreedy algorithm in Algorithm 2.
- **IICRev** ---- Change the heuristic function in Algorithm 2 and make it related to the revenue.
- **RDG** ---- Revenue Difference Greedy heuristic algorithm in Algorithm 3.
- **DR** ---- Degree Rank heuristic algorithm in Algorithm 4.
- **DD** ---- Degree Discount heuristic algorithm in Algorithm 5.

Time Complexity

**Log
y-axis
!!!**

Random > DD ≈ DR > RDG > IIC > IICRev

Revenue and Seed Set Size

cost of seed node = 0.5

payoff of informed node = 0.5 payoff of active node = 1

(a) seed node cost = 0.8

(b) seed node cost = 1.2

IICRev > IIC ≈ DD > RDG > DR > Random

Revenue and Payoff/Cost Value

payoff of active node = 1 seed size = 50

IICRev > IIC ≈ DD > RDG ≈ DR > Random

Conclusion

- IICRev

very simple network
strong computation ability
no requirement for time

Tractable

High revenue

DD

- DD/RDG

relaxation on revenue maximization
high complexity network
DD has lower time complexity

Thank You
