

Final Project Report

Wang yuxin,Yu cong, Zhou qinye,Zuo yaxi

Group 9

We made a website mostly on what we learned this semester. The website includes a homepage, an author-searching page, a conference-searching page, the authors' personal pages and the conferences' pages with basic functions. The pages are linked to a database when called. Auto-complete and relationship graphs are added as advanced functions.

Contents

1 Problem Describing	2
1.1 basic part	2
1.2 Improve part(Direction for reference)	2
2 Problem Analysis and Solution	2
2.1 basic part	2
2.1.1 part 1—search for paper title and conference	2
2.1.2 part 2—add paper and conference pages in the website	5
2.1.3 part 3—paging funcion	6
2.2 improving part	10
2.2.1 part 1—recommend paper	10
2.2.2 part 2—beautify the web page	13
2.2.3 part 3—the graph of the author relationship	17
3 Results Display	19

¹ **1. Problem Describing**

² *1.1. basic part*

³ Integrate the website system completed before, improve the function and
⁴ optimize the interface.

- ⁵ • Search results page increases search for paper title and conference.

- ⁶ • Add paper and conference pages on the website

- ⁷ • When displaying information, each page displays more information
⁸ items (such as search results and papers).List, etc., showing 10 pages
⁹ per page and adding the function of page break.

¹⁰ *1.2. Improve part(Direction for reference)*

- ¹¹ • Papers recommended (such as recommendation by co authors and com-
¹² mon references) are available in papers. The pages can be recommended
¹³ by relevant papers, and can also be read on the scholar page through
¹⁴ this scholar's thesis.The recommendation of closing the paper and so
¹⁵ on.

- ¹⁶ • Search results are no longer based on simple MySQL queries, and can
¹⁷ be checked with Solr or elasticsearch to realize the cable function.

- ¹⁸ • The tree structure of teacher relationship shows that we can expand
¹⁹ the teacher relationship tree by layer. In addition to the examination.
²⁰ Worry about the possibility that a scholar may have multiple tutors.

- ²¹ • Website performance acceleration, database optimization, SQL state-
²² ment optimization, etc.

²³ **2. Problem Analysis and Solution**

²⁴ *2.1. basic part*

²⁵ *2.1.1. part 1—search for paper title and conference*

²⁶ Combined with the previous situation, there are totally three informa-
²⁷ tion(author name, paper title and conference) can be searched in the home
²⁸ page. In order to realize the goal, we add two search boxes to search the
²⁹ paper title and conference just like what we do in the lab2.The following is
³⁰ the realization of adding the paper title search box.

```

31.1 <form action="result_paper1.php" method="get">
32.2 <center>PaperTitle<input type="text" id="papertitle" name=
33.3     papertitle">
34.3 <input type="submit" value="Search"><br></center>
35.4 </form>
```

36 Then, we also need to realize the automatic complementing function. Firstly,
37 we write the javascript code in the home page like this.

```

38.1 <script>
39.2   $(document).ready(function() {
40.3     $('#papertitle').autocomplete({
41.4       source: "hint_3.php",
42.5       minLength: 1
43.6     });
44.7   });
45.8 </script>
```

46 Secondly, we shoule finish the code in hint3.php just like this.

```

47.1 <?php
48.2 include_once("connect.php"); //connect with the database
49.3 //get the information of people entering
50.4 $p = "%" . "%". $_GET['term'] . "%";
51.5 $con = mysql_connect("localhost", "root", "") ;
52.6 mysql_select_db("text_1", $con);
53.7 $it = sprintf('select title
54.8   from papers
55.9   where title like %
56.0   limit 0,10;', $p);
57.1 $result1 = mysql_query($it, $con);
58.2 $data = array();
59.3 while ($row = mysql_fetch_array($result1))
60.4 {
61.5   array_push($data, array("label"=>trim($row['title'])));
62.6 }
63.7 echo json_encode($data); //output the data in the form of json
64.8 mysql_close($con);
65.9 ?>
```

66 In addition, in order to reduce the use of the code, we write a file named
67 connect.php which is used to connect with the database. Therefore, when we
68 need to connect with the database, we just need to include the file and select
69 the database. Here is the connect.php.

```

70.1 <?php
71.2 $host = "localhost";
```

```

723 $db_user="root";
734 $db_pass="";
745 $db_name="text_1";
756 $timezone="Asia/Shanghai";
767
778 $link=mysql_connect($host,$db_user,$db_pass);
789 mysql_select_db($db_name,$link);
790 mysql_query("SET names UTF8");
801
812 header("Content-Type: text/html; charset=utf-8");
823 ?>

```

Up to now, we finish adding the search of paper title. Similarly, we can add the search of conference. Here are the code about the search of conference in the home page.

```

861 <form action="result_conference2.php" method="get">
872 <center>conference<input type="text" id="conference" name=
88     "conference">
893 <input type="submit" value="Search"><br></center>
904 </form>
915 <script>
926     $(document).ready(function(){
937         $('#conference').autocomplete({
948             source: "hint_2.php",
959             minLength: 1
960         });
971     });
982 </script>

```

Here is the code in hint2.php. It is mainly different from the hint3.php in the aspect of sql statement.

```

1011 <?php
1022 include_once("connect.php"); //connect with the database
1033 //get the information of people entering
1044 $p="%" . "%" . $_GET['term'] . "%\%";
1055
1066 $con = mysql_connect("localhost","root","");
1077 mysql_select_db("text_1", $con);
1088 $it=sprintf('select conferencename
1099     from conferences
1100     where conferencename like %s;', $p);
1111 $result1 = mysql_query($it, $con);
1122 $data=array();
1133 while($row = mysql_fetch_array($result1))
1144 {

```

```

1155     array_push($data, array("label"=>trim($row['conferencename']))))
116     ;
1176 }
1187 echo json_encode($data); //output the data in the form of json.
1198 mysql_close($con);
1209 ?>

```

121 2.1.2. part 2—add paper and conference pages in the website

122 In this part,we use sql statement to find the information we need.First,
 123 we get the information from home by the method of get.And search the
 124 title,paperpublishyear and paperid from papers.

```

1251 $s=$_GET["papertitle"];
1262 $result = mysqli_query($con,"SELECT title ,paperpublishyear ,
127   paperid from papers
1283 WHERE title LIKE '%{$s}%' ");

```

129 Second,use the paperid we just get to search the another information and
 130 output them.

```

1311 while ($row = mysqli_fetch_array($result ,MYSQLI_ASSOC) and $n<$i
132   +10)
1332 {
1343   $paper=$row['paperid'];
1354   $result1=sprintf("SELECT authorname ,paper_author_affiliation .
136   authorid from paper_author_affiliation
1375   join authors on authors.authorid=
138   paper_author_affiliation.authorid
1396   WHERE paper_author_affiliation.paperid ='%s ',$paper);
1407   $query2=mysqli_query($con , $result1);
1418   $row2=mysqli_fetch_array($query2 ,MYSQLI_ASSOC);
1429   $tmp=mysqli_query($con,"select conpaperid from conection
1430   where paperid='{$paper}' limit 0,3");
1441   echo "<tbody><tr><td>{$row['title']}

```

150 Besides,the code about realization of the paging function and recommend
 151 paper in the paper.php will be showed in the part 3 of basic part and the
 152 improving part.

153 Similarly,we can finish the conference.php.The following is the code.

```

154 1 $s = $_GET["conference"];
155 2 $result = mysqli_query($con , "SELECT * FROM conferences
156 3 where ConferenceName LIKE '%{$s}%' ");
157 4 $row = mysqli_fetch_array($result ,MYSQLI_ASSOC);
158 5 $connname=$row[ 'ConferenceName' ];
159 6 $conid=$row[ 'ConferenceID' ];
160 7
161 8 echo '<table class="table table-striped table-bordered"><tbody>
162 <tr><td>paper title</td><td>Recommended paper</td><td>
163 paperpublish year</td><td>authorname</td></tr></tbody>';
164 9 $result2=mysqli_query($con , "SELECT * FROM papers
165 0 where ConferenceID='{$conid}'");
166 1 while($row2 = mysqli_fetch_array($result2 ,MYSQLI_ASSOC))
167 2 {
168 3 {
169 4 $paper=$row2[ 'PaperID' ];
170 5
171 6 $result1=sprintf("SELECT authorname ,paper_author_affiliation .
172 authorid from paper_author_affiliation
173 7 join authors on authors.authorid=
174 paper_author_affiliation .authorid
175 8 WHERE paper_author_affiliation .paperid ='%s ',$paper);
176 9 $query2=mysqli_query($con , $result1);
177 0 $row3=mysqli_fetch_array($query2 ,MYSQLI_ASSOC);
178 1
179 2 $papertitle=$row2[ 'Title' ];
180 3 $ppy=$row2[ 'PaperPublishYear' ];
181 4 $tmp=mysqli_query($con , " select conpaperid from conection
182 5 where paperid='{$paper}' limit 0,3");
183 6 echo "<tbody><tr><td> {$papertitle}</td> ".
184 7 "<td>{$ppy}</td>" .
185 8 "<td><a href=/author11.php?id=$row3 [ authorid]>{$row3 [
186 authorname']}</a></td>" .
187 9 "</tr></tbody>";

```

188 2.1.3. part 3—paging funcion

189 In this part, we will show how to realize the paging function in the
190 result.php. As for the realization of paging function in other page, because the
191 implementation methods are all the same, we will not say much about it.
192 First, I create a new file named result11.php. Then, in the file, I first include
193 the jquery.

```

194 1 <script src="http://cdn.static.runoob.com/libs/jquery/1.10.2/
195 jquery.min.js">
```

```
196 2 </script>
```

197 Then I define two function (previous and next) to execute the page function.
198 And in this two functions,we first need to use the way of get to get the
199 data from result10.php.Second use the document.getElementById("da").innerHTML=data
200 of HTML DOM to replace the content which id="da" by data;Here is the
201 function previous:

```
202 1 function previous () {  
203 2     $(document) . ready ( function () {  
204 3         $. get (" result10 . php " , function ( data , status ) {  
205 4             document . getElementById (" da " ) . innerHTML = data ;  
206 5         } );  
207 6     } );  
208 7 }
```

209 Besides,since there is a browser compatibility problem in the code above,so
210 I use the following code to replace the "document.getElementById("da").innerHTML=data;"
211 `$("#da") . html (data) ;`

212 In addition, we should sent a data(i) to the result10.php, the function of
213 i is to limit the number of query result in one page.I let my website has 10
214 record each page. so when click on the Previous button, i should decrease
215 10. And when we click the button Next, i should increase 10.And I use
216 "window.location.search" to send the i to result10.php.Here is the function
217 next():

```
218 1 var i = - 9 ;  
219 2 function next () {  
220 3     i = i + 10 ;  
221 4     $( document ) . ready ( function () {  
222 5         $. get (" result10 . php " + window . location . search + "&i=" + String ( i ) ,  
223         function ( data , status ) {  
224 6             $( "#da" ) . html ( data ) ;  
225 7         } );  
226 8     } );  
227 9 }
```

228 And we should use " i " in the result10.php which is for query imformation.
229 It is same as the result.php in lab2 except using "i". I just get the
230 data "i" and add a conditional statement in the origon loop statement.The
231 following is the difference:

```
232 1 $i=$_GET[ " i " ] ;  
233 2 $n=0;
```

```

234 3 while ($row = mysqli_fetch_array($retval, MYSQL_ASSOC) and $n < $i
235 4     +10)
236 4 {
237 5     $n=$n+1;
238 6     if ($n>=$i)
239 7     {
240 8         $sql1=sprintf('select affiliations.affiliationname ,count(*)
241 9             from affiliations join paper_author_affiliation on
242 9                 affiliations.affiliationid=paper_author_affiliation.
243 9                     affiliationid
244 9             where authorid=%s"
245 10            group by paper_author_affiliation.affiliationid order by count
246 11                (*) desc limit 1' ,$row[ 'authorid ']);
247 12        $retval1 = mysqli_query( $conn, $sql1 );
248 13        if( ! $retval1 )
249 14        {
250 15            die( 'can not read data: ' . mysqli_error($conn));
251 16        }
252 17        $row1=mysqli_fetch_assoc($retval1);
253 18        echo "<tr><td> {$row[ 'authorid ']}</td> ".
254 19            "<td><a href=/author11.php?id={$row[ 'authorid ']}>{$row[ 'authorname ']}</a></td> ".
255 20            "<td>{$row[ 'count(*) ']}</td> ".
256 21            "<td>{$row1[ 'affiliationname ']}</td>" .
257 22            "</tr>";
258 23        mysqli_free_result($retval1);
259 24        $sql1='';}
260 25    }

```

Listing 1: result10.php

262 The following is the origin result.php:

```

263 1 $n=1;
264 2 while ($row = mysqli_fetch_array($retval, MYSQL_ASSOC))
265 3 {
266 4     $sql1=sprintf('select affiliations.affiliationname ,count(*)
267 5             from affiliations join paper_author_affiliation on
268 5                 affiliations.affiliationid=paper_author_affiliation.
269 5                     affiliationid
270 6             where authorid=%s"
271 7            group by paper_author_affiliation.affiliationid order by count
272 8                (*) desc limit 1' ,$row[ 'authorid ']);
273 9        $retval1 = mysqli_query( $conn, $sql1 );
274 10       if( ! $retval1 )
275 11       {
276 12           die( 'can not read data: ' . mysqli_error($conn));

```

```

277.2 }
278.3 $rowl=mysqli_fetch_assoc($retvall);
279.4 echo "<tr><td> {$row[ 'authorid ']}</td> ".
280.5 " <td><a href=/author.php?id=$row[ authorid ]>{$row[ 'authorname ']} </a></td> ".
281 " <td>{$row[ 'count (*) ']} </td> ".
282.6 " <td>{$rowl[ 'affiliationname ']}</td>" .
283.7 " </tr> ";
284.8 mysqli_free_result($retvall);
285.9 $n=$n+1;
286.0 if ($n>10) break;
287.1 $sql1=';
288.2 }
289.3 }
```

Listing 2: result.php

Finally, we just need to use "onclick" to connect the button with the function and write a `jpç` which id is da to be the replaced object.

```

292.1 <p id="da">
293.2 </p>
294.3 <button id="button1" onclick="previous()">Previous</button>
295.4 <button id="button2" onclick="next()">Next</button>
```

The following is the complete code of result11.php:

```

297.1 <!DOCTYPE html>
298.2 <html>
299.3 <head>
300.4 <meta charset="utf-8">
301.5 <script src="http://cdn.static.runoob.com/libs/jquery/1.10.2/
302.6     jquery.min.js">
303.6 </script>
304.7 <script>
305.8 var i=-9;
306.9 function next(){
307.0     i=i+10;
308.1     $(document).ready(function(){
309.2         $.get("result10.php"+window.location.search+"&i="+String(i),
310.3             function(data,status){
311.4                 //document.getElementById("da").innerHTML=data;
312.5                 $("#da").html(data);
313.5             });
314.6         });
315.7     });
316.8 };
317.9 function previous(){
```

```

3180     i=i-10;
3191     $(document).ready(function(){
3202         $.get("result10.php"+window.location.search+"&i="+String(i),
321         function(data, status){
3223             //document.getElementById("da").innerHTML=data;
3234             $("#da").html(data);
3245         });
3256     });
3267 };
3278 next();
3289 </script>
3290 </head>
3301 <body>
3312 <center>Author name: <?php echo $_GET["name"]; ?><br></center>
3323 <center>The results are as follows:<br>
3334 <p id="da">
3345 </p> </center>
3356 <center>
3367 <button id="button1" onclick="previous()">Previous</button>
3378 <button id="button2" onclick="next()">Next</button></center>
3389 </body>
3390 </html>

```

340 Similarly, we can execute page function in other pages just doing the same
 341 things in the above. So I don't talk something more.

342 *2.2. improving part*

343 *2.2.1. part 1—recommend paper*

344 At first, we recommended the other articles of the first author of the target
 345 article. But the relationship between the two articles is too weak. Under the
 346 advice of other students, we first find all the articles of the author of the
 347 article, in which we find articles that have a reference to the target article,
 348 as a recommendation article.

349 First, we set up an associated form(conection) through the python statement.
 350 Define a function to find all the articles written by the author of the target
 351 paper.

```

3521 def allpapers(paperid):
3532     l=[]
3543     sql1=""" select authorID from paper_author_affiliation where
355     paperID={} """.format(paperid)
3564
3575
3586

```

```

359 7     cursor.execute(sql1)
360 8
361 9     results = cursor.fetchall()
362 0     for row in results:
363 1         authorid=row[0]
364 2         sql2 = """select paperID from paper_author_affiliation
365 where authorID={} and paperID!={}""".format(authorid,
366 paperid)
367 3
368 4         cursor.execute(sql2)
369 5         results2 = cursor.fetchall()
370 6         for row2 in results2:
371 7             if row2[0] not in l:
372 8                 l.append(row2[0])
373 9
374 0
375 1     return l

```

376 Define a function to find all the quoted articles in a given article.

```

377 1 def reference(id):
378 2     l=[]
379 3     sql3=""" select referenceID from paper_reference where
380 paperID ={} """.format(id)
381 4     cursor.execute(sql3)
382 5     results3 = cursor.fetchall()
383 6     for row in results3 :
384 7         l.append(row[0])
385 8     return l

```

386 If the article A B has the same author, and A B has a reference relationship. The definition of the two articles is related.

```

388 1 def conn(idA,idB):
389 2     lb=reference(idB)
390 3     if idA in idB:
391 4         return True
392 5     la=reference(idA)
393 6     for i in lb:
394 7         if i in la:
395 8             return True
396 9     return False

```

397 Set up a table "conexion"

```

398 1 sql1=""" select paperID from papers """
399 2 cursor.execute(sql1)
400 3 results=cursor.fetchall()

```

```

401.4 for row in results:
402.5     paperid=row[0]
403.6     l=allpapers(paperid)
404.7     for i in l:
405.8         if conn(paperid,i):
406.9             sql2 = """insert into conection(paperID ,conpaperid)
407.0                 values ("{}","{}")""".format(paperid,i)
408.1             cursor.execute(sql2)
409.2             connection.commit()
410.3
411.4
412.5 connection.close()

```

413 Query through the PHP statement directly to the table to find the recommended articles.

```

415.1 $tmp=mysqli_query($con,"select conpaperid from conection
416.2      where paperid='{$paper}' limit 0,3");

```

417 Add hyperlinks to jump to the display page.

```

418.1 $name_tmp=$name_tmp."<a href=/result_tmp_paper2.php?tmp_id=". 
419.2      $tmp2_row[ 'paperid '].">".$tmp2_row[ 'title ']."</a>". "<br>";}

```

420 The display page displays the article's title, authorname and publishyear.

```

```

458 *2.2.2. part 2—beautify the web page*

459 In this part, we will show how we beautified the website frontend using
460 HTML commands and css files.

461 *Home page.* Firstly, we downloaded a mature website template from moke8.com.
462 It contained an HTML page and a css file. Then we made changes to the
463 original files.

464 Our beautification is mainly done on the homepage. The whole homepage
465 is divided into two parts: the searching part which immediately shows up
466 when connecting the website, and the part that shows our group members'
467 names, which needs the users to roll down to the end of the page. In the
468 searching part, three searching boxes are used to search different messages.
469 Two background photos are added to the website, one can roll up and down
470 with the searching boxes, and the other is fixed as a background.

471 The css files allows us to set the specific scale of each part, and every part
472 are independent from each other. When calling the settings, it only needs a
473 class command to use them. By this way, the html commands and the logic
474 can be clearer, and the change of appearance and the change of parts are
475 independent from each other.

476 The details of our final works on beautification are shown as follows:
477 Title command allows the website open with a title, otherwise it will show
478 the default name of its root file.

```

479.1 <title>Home</title>

```

480 An floating button is added on the fixed part of the page however the
481 page rolls.

```
482 1 <nav class="cd-stretchy-nav edit-content">  
483 2 <a class="cd-nav-trigger" href="#0"> Menu <span aria-hidden="  
484     true"></span> </a>  
485 3 <span aria-hidden="true" class="stretchy-nav-bg"></span>  
486 4 </nav>
```

487 The banner part completes the main functions of the homepage. We have
488 modified the original css file, thus the boxes and buttons with the effects we
489 want can be called in this class. For details, the imformation each box can
490 search, such as “Author”, “Conference” and “Papertitle”, can be shown in the
491 boxes using “placeholder=...” settings.

```
492 1 <div class="banner-w3ltext">  
493 2   <div class="container">  
494 3     <h2>SEARCHING!</h2>  
495 4     <h3>start here</h3>  
496 5   </div>  
497 6   <div class="contact-w3ls-row">  
498 7     <form action="result11.php" method="get">  
499 8       <input class="author" type="text" id="name" name="name"  
500         placeholder="Author">  
501 9     <div class="col-md-2 col-xs-4 place-grid">  
502 0       <input class="wthree-btn" type="submit" data-toggle="modal"  
503         value="Search"><br>  
504 1     </div>  
505 2   </form>  
506 3   <script>  
507 4     $(document).ready(function () {  
508 5       $('#name').autocomplete({  
509 6         source: "hint.php",  
510 7         minLength: 1  
511 8       });  
512 9     });  
513 0   </script>  
514 1   <p class="wthree-ttext"></p>  
515 2   <form action="result_conference2.php" method="get">  
516 3     <input class="conference" type="text" id="conference" name="  
517         conference" placeholder="Conference">  
518 4     <div class="col-md-2 col-xs-4 place-grid">  
519 5       <input class="wthree-btn" type="submit" data-toggle="modal"  
520         value="Search"><br>  
521 6     </div>  
522 7   </form>
```

```

5238 <script>
5239   $(document).ready(function () {
5240     $('#conference').autocomplete({
5241       source: "hint_2.php",
5242       minLength: 1
5243     });
5244   });
5245 </script>
5246 <p class="wthree-ttext"></p>
5247 <form action="result_paper1.php" method="get">
5248 <input class="paper" type="text" id="papertitle" name=
5249   papertitle placeholder="Papertitle">
5250 <div class="col-md-2 col-xs-4 place-grid">
5251 <input class="wthree-btn" type="submit" data-toggle="modal"
5252   value="Search"><br>
5253 </div>
5254 </form>
5255 <script>
5256   $(document).ready(function () {
5257     $('#papertitle').autocomplete({
5258       source: "hint_3.php",
5259       minLength: 1
5260     });
5261   });
5262 </script>
5263 <p class="wthree-ttext"><br></p>
5264 </div>
5265 </div>

```

551 We didn't do much change to the slide effect. The codes are shown as
 552 follows:

```

553 1 <script defer src="js/jquery.flexslider.js"></script>
554 2 <script type="text/javascript">
555 3 $(window).load(function (){
556 4   $('.flexslider').flexslider({
557 5     animation: "slide",
558 6     start: function(slider){
559 7       $('body').removeClass('loading');
560 8     }
561 9   });
562 0 });
563 1 </script>
564 2 <script type="text/javascript">
565 3   jQuery(document).ready(function($) {
566 4     $('.scroll').click(function(event){

```

```

567.5     event.preventDefault();
568.6     $( 'html, body' ).animate( { scrollTop:$( this.hash ).offset().top
569     },1000);
570.7     });
571.8   });
572.9 </script>
573.0 <script src="js/modernizr.js"></script> <!-- Modernizr -->
574.1 <script src="js/menu.js"></script> <!-- Resource jQuery -->
575.2 <script src="js/jquery.filterizr.js"></script>
576.3 <script src="js/controls.js"></script>
577.4 <script type="text/javascript">
578.5   $(function() {
579.6     $('.filtr-container').filterizr();
580.7   });
581.8 </script>
582.9 <!-- swipe box js -->
583.0 <script src="js/jquery.swipebox.min.js"></script>
584.1 <script type="text/javascript">
585.2   jQuery(function($) {
586.3     $(".swipebox").swipebox();
587.4   });
588.5 </script>

```

589 *Other pages.* And in other pages, we set the background photos, the color
 590 and size of words and the size of button. 1.set the background photo

```

591.1 <head>
592.2   <meta charset="utf-8">
593.3   <meta name="viewport" content="width=device-width, initial-
594     scale=1">
595.4   <link rel="stylesheet" href="https://apps.bdimg.com/libs/
596     bootstrap/3.2.0/css/bootstrap.min.css">
597.5 </head>
598.6 <style>
599.7 #example1 {
600.8   background-image: url(3.jpg);
601.9   background-position: right bottom, left bottom;
602.0   background-repeat: repeat, repeat;
603.1   padding: 100px;
604.2   background-size: 100% 100%;
605.3 }
606.4 </style>
607.5 <body>
608.6 <div id="example1">
609.7 // other code

```

```
610 8 </div>
611 9 </body>
```

612 2.set the color and size of words

```
613 1 <style>
614 2 h { font-size:40px; }
615 3 h{ color:#FFF8DC}
616 4 </style>
617 5 <body>
618 6 <center><h>Conference Name: <?php echo $_GET["conference"] ; ?><
619     br></h></center>
620 7 <center><h>The results are as follows:</h><br>
621 8 </body>
```

622 3.set the size of button

```
623 1 <center>
624 2 <button id="button1" onclick="previous()" style="height:35px;
625     width:70px;">Previous</button>
626 3 <button id="button2" onclick="next()" style="height:35px; width:70
627     px;">Next</button></center>
```

628 2.2.3. part 3—the graph of the author relationship

629 First, we have to find all people who has cooperated with the author and
630 judge whether he/she is the author's teacher or student using the classification
631 trained in lab three. To speed up the searching process, I choose to write all
632 the relationship into a new table so the program just needs to search in the
633 table while the user is operating. Second, make the relationship visualizable
634 by using a picture. This should be written into a .json file and the main
635 process has been given in the net provided.

636 Create New Table

637 First, find all the authors and their ID that have published the same
638 paper. The sql sentence is like the following shows.

```
639 1 a=""" select AuthorID ,AuthorName from authors"""
640 2 b=""" select PaperID from paper_author_affiliation
641 3     where AuthorID='{}'""".format(author1)
642 4 c=""" select AuthorID from paper_author_affiliation
643 5     where PaperID='{}'""".format(paper[0])
644 6 d=""" select AuthorName from authors
645 7     where AuthorID='{}'""".format(author2)
```

646 Then, we have to judge whether the second one is the teacher or student
647 of the first one. With the preparation of lab three, it's easy to execute. We

648 use label1 to show if the former is the teacher of the latter, and label2 to
649 show if the former is the student of the latter. The code in python is like the
650 following.

```
651 1 lr = LogisticRegression()  
652 2 lr=joblib.load('lr.model')  
653 3 feature1=feature(author1,author2,cursor)  
654 4 feature2=feature(author2,author1,cursor)  
655 5 test1=np.array(feature1)  
656 6 test2=np.array(feature2)  
657 7 test1=test1.reshape(1,-1)  
658 8 test2=test2.reshape(1,-1)  
659 9 label1=lr.predict(test1)  
660 0 label2=lr.predict(test2)
```

661 Next, it's time to create a new table and insert data into it. The sql
662 sentence to insert data is:

```
663 1 sql_="""insert into co_relation  
664 2     (Author1 ,Name1 ,Author2 ,Name2 ,Label1 ,Label2 )  
665 3     values({0},{1},{2},{3},{4},{5});"""\  
666 4     .format(author1 ,name1[1] ,author2 ,name2[0][0] ,int(label1  
667 5 [0]) ,int(label2[0]))  
668 cursor.execute(sql_)
```

669 Write .json File

670 First, find all the related person and their ID and write them into .json
671 file as nodes. The code is partly shown below:

```
672 1 $array = array();  
673 2 $arrayid=array();  
674 3 $label1=array();  
675 4 $label2=array();  
676 5  
677 6 $sql1="SELECT Author2 ,Name2 ,Label1 ,Label2 FROM co_relation WHERE  
678 7     Author1='".$t.'";  
679 7 $result1 = mysqli_query($con,$sql1);  
680 8 while($row1=mysqli_fetch_array($result1,MYSQLNUM))  
681 9 {  
682 10     array_push($arrayid,$row1[0]);  
683 11     array_push($array,$row1[1]);  
684 12     array_push($label1,$row1[2]);  
685 13     array_push($label2,$row1[3]);  
686 14 }  
687 5  
688 6 $sql2="SELECT AuthorName FROM author WHERE AuthorID='".$t.'";  
689 7
```

```

6907 $result2 = mysqli_query($con , $sql2);
6918 $row2=mysqli_fetch_array($result2 ,MYSQLNUM);
6929
6930 $len=sizeof($arrayid);
6941
6952 $filename = "D:/xampp_/htdocs/tmp.json";
6963 $handle=fopen($filename , "w");
6974 $content="";
6985 \\"nodes\":[
6996 ";
7007 $str=fwrite($handle , $content);
7018 fclose($handle);
7029
7030 $handle=fopen($filename , "a+");
7041 for ($i=0;$i<$len ; $i++)
7052 {
7063     if (((int)$label1[$i]==0 and (int)$label2[$i]==0) or (int)
707 $label1[$i]==1 and (int)$label2[$i]==1)
7084     {
7095         $content="      {\\"id\":\\"", . $array[$i] . \" \" . $arrayid[$i] . "
710 \\",\\\"group\\"", :4},
7116 ";
7127             $str=fwrite($handle , $content);
7138     }
7149 }
7150
7161 $content="      {\\"id\":\\"", . $row2[0] . \" \" . $t . \" \\",\\\"group\\"", :1}
7172 ";
7183 $str=fwrite($handle , $content);

```

719 Then, write their relationship into .json file as links(code also partly
720 showed).

```

7211 for ($i=0;$i<$len ; $i++)
7222 {
7233     $content="      {\\"source\":\\"", . $row[0] . \" \" . $t . \" \\",\\\"target
724 \":\\"", . $array[$i] . \" \" . $arrayid[$i] . \",\\\"value\\"", :1},
7254 ";
7265     $str=fwrite($handle , $content);
7276 }

```

728 Finally, we just need to use the tmp.json file to draw the picture.

729 3. Results Display
